HERE Geo Enrichment Template

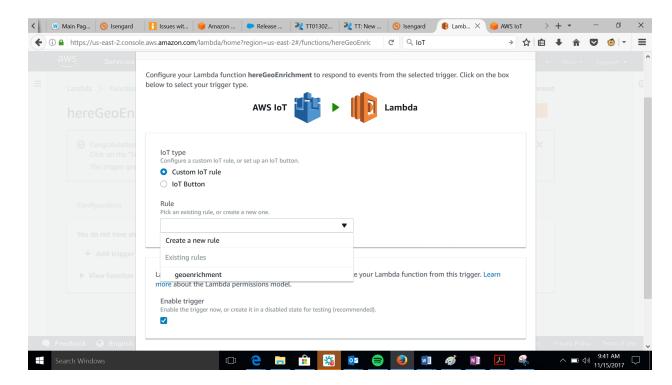

Readme

HERE Technologies provides geo-enrichment services which may called in AWS IoT rules to enrich IoT messages or take geolocation based actions. This is repo provides a python template for a lambda function which maybe called from SELECT or WHERE statements of the rule to check if coordinates are inside a geofenced region.

Pre-requisites: HERE developer account, a valid geo-fence layer. Please refer HERE documentation to learn how to upload a layer for geo-fencing.

Set-up:

- 1. Set-up a Lambda Function with Python 2.7
- 2. In the "Triggers" tab set-up an AWS IoT trigger for your Lambda Function. Select the rule you want to trigger your lambda function from. See next section to learn how to set-up an IoT Rule.

3. Copy the sample code into editor and enter app_id and app_code as environment variables.

Dashboard	<		© X
nctions			
	Environment variables		
	You can define Environment Variables as key without the need to change function code. L	y-value pairs that are accessible from your function code. These are useful to store .earn more.	e configuration settings
	app_id	Enter HERE developer App ID here	Remove
	app_code	Enter HERE developer App Code here	Remove
	Кеу	Value	Remove
	Key Encryption configuration	Value	Remove
		Value	Remove

4. Save and Test. Use the following event as the test event:

Configure test event					
		_			

A function can have up to 10 test events. The events are persisted so you can switch to another computer or web browser and test your function with the same events.

○ Create new test eve	ent			
• Edit saved test ever	its			
Saved Test Event				
GeoEvent		•	C	
1 - {				
	7.669814, -122.417352",			
3 }				

Instructions on setting up an IoT Rule

- 1. Navigate to the **Act** section in the IoT console.
- 2. Create a Rule, and edit the SQL query to add your Lambda Function as a condition (to the WHERE clause)

	Rule query statement	-0
÷	Using SQL version 💿	ţ,
	2016-03-23 •	?
	Rule query statement	
	SELECT 'event' as event FROM 'state' WHERE aws_lambda("arn:aws:lambda:us-east-1:account_id:function:lambda_func	
	< > Attribute	
	'event' as event	
	Topic filter	
	state	
	Condition	
	aws_lambda("arn:aws:lambda:us-east-1:account_id:function:lambda_function", event).geometries.distance < 0	
	Cancel Update	

Note: the "event" variable is assumed to be a JSON structure containing the coordinates (in an attribute "coord") to be used in the Lambda Function.

3. Configure the Action(s) you wish to take to act on the geofencing information returned by the Lambda Function. Refer the full documentation on AWS IoT Rules here.
